# DEFINITIONS AND FORMULAS

RESIDENCE DATA — data allocated by place of residence of the decedent (deaths), or by place of residence of the child's mother (births, fetal deaths).

OCCURRENCE DATA — data allocated by place where event occurred, regardless of the person's place of residence (marriages, divorces).

LIVE BIRTH — a birth that shows any sign of life after delivery.

(CRUDE) BIRTH RATE — number of live births per 1,000 population.

$$\left(\frac{\text{live births}}{\text{population}} \times 1{,}000\right)$$

FERTILITY RATE — number of live births per 1,000 women 15-44 years of age.

$$\left(\frac{\text{live births}}{\text{females 15-44}} \times 1{,}000\right)$$

OUT-OF-WEDLOCK RATIO — number of out-of-wedlock live births per 1,000 live births.

$$\left(\frac{\text{out-of-wedlock live births}}{\text{live births}} \times 1{,}000\right)$$

IMMATURE BIRTH — a live birth weighing 2500 grams (5½ pounds) or less.

IMMATURE BIRTH RATE — number of immature live births per 1,000 live births.

$$\left(\frac{\text{immature live births}}{\text{live births}} \times 1{,}000\right)$$

STILLBIRTH — a spontaneous fetal death of at least 20 weeks gestation or a weight of at least 350 grams (does not include any induced abortions).

STILLBIRTH RATIO — number of stillbirths per 1,000 live births.

$$\left(\frac{\text{stillbirths}}{\text{live births}} \times 1{,}000\right)$$

INFANT DEATH — death of an infant under one year of age.

INFANT DEATH RATE — number of infant deaths per 1,000 live births.

$$\left(\frac{\text{infant deaths}}{\text{live births}} \times 1{,}000\right)$$

NEONATAL DEATH — death of an infant within the first 27 days of life.

NEONATAL DEATH RATE — number of neonatal deaths per 1,000 live births.

$$\left(\frac{\text{neonatal deaths}}{\text{live births}} \times 1{,}000\right)$$

PERINATAL DEATH — includes stillbirths and deaths to infants within the first six days of life.

PERINATAL DEATH RATIO — number of perinatal deaths per 1,000 live births.

$$\left(\frac{\text{perinatal deaths}}{\text{live births}} \times 1{,}000\right)$$

MATERNAL DEATH — death attributable to complications of pregnancy, childbirth, or the puerperium.

MATERNAL DEATH RATE — number of maternal deaths per 10,000 live births.

$$\left(\frac{\text{maternal deaths}}{\text{live births}} \times 10{,}000\right)$$

(CRUDE) DEATH RATE — number of deaths per 1,000 population.

$$\left(\frac{\text{deaths}}{\text{population}} \times 1{,}000\right)$$

CAUSE-SPECIFIC DEATH RATE — number of deaths from a specific cause per 100,000 population.

$$\left(\frac{\text{deaths from specific cause}}{\text{population}} \times 100{,}000\right)$$

# POPULATION

Each year, the population estimates for Idaho are made available by the Federal-State Cooperative Program for Local Population Estimates. All vital rates are based on provisional 1984 estimates unless otherwise specified. Also included are estimates for 1981-83. Vital rates for those years have been adjusted.

Since the 1980 census, Idaho's population has grown by 6.0%, and has finally surpassed one million in population (1,001,000). The chart on the following page shows that Idaho has been the 16th fastest growing state since the census. Alaska had the highest growth rate (24.4%) in the nation for the same period (1980-84). Most states experiencing a rapid rate of growth are in the western part of the nation.

In Idaho, the fastest growing area from 1980-84 was District 4 (central Idaho), with a growth rate of 8.7%. District 5 (south central) and District 7 (northeast) grew by 8.1% and 7.8%, respectively. District 2 (north central) experienced a 1.4% growth, the lowest for the period.

At the county level, the fastest growing county was Custer, with a growth rate of 82.4%; Blaine County was second with a growth rate of 29.2%. Thirteen counties lost population; Shoshone County had the highest rate of loss of 9.6%.

The largest numerical increase occurred in Ada County (16,100), followed by Kootenai and Canyon Counties with increases of 5,900 and 4,000, respectively; Shoshone County lost the most numerically (-1,900).

Also in this issue are the latest population estimates for Idaho cities as of July 1, 1982. These estimates have also been made available by the Federal-State Cooperative Program for Local Population estimates. For the period 1980-82, the cities of Clayton and Challis, both in Custer County, had the highest rate of population gain, 62.8% and 59.4%, respectively. This increase reflects the fact that Custer County as a whole had the highest rate of gain for 1980-84. The city of Placerville experienced the highest rate of population loss (-15%).

# Trends and Summary

*Mountain berries abound in Idaho, and include rich huckleberries and blueberries that make pancakes, pies, cobbler and even ice cream, "Idaho-special."*

## TRENDS IN IDAHO

**BIRTHS** ..... Reversing the pattern of the 1970's, the Idaho birth rate has decreased the last five years. At 18.0 (provisional), it stands at its lowest level in decades. The number of births has also declined to its lowest point since 1976, even though the population has grown considerably. In 1984, 17,996 births occurred to Idaho mothers, a decrease of 4%.

**OUT-OF-WEDLOCK BIRTHS** ... Out-of-wedlock births decreased in 1984 for the first time in a decade, to 1,668 (92.4 per 1,000 live births). Between 1974 and 1983, the number of out-of-wedlock births had risen 86%; during the same time the ratio had increased from 61.0 to 94.1. Districts 1 and 3 continue to record the highest ratios, with District 2 a close third.

**DEATHS** ..... The number of Idaho deaths increased just 0.3% in 1984 to 7,229. The rate of death has ceased the long-term downward trend in evidence during the sixties and seventies, although dropping slightly from 7.3 in 1983 to 7.2 (provisional) in 1984.

**STILLBIRTHS** ..... Both the number and ratio of stillbirths change little from year to year, although a general decline has been evident over the last several years. In 1984, 140 stillbirths occurred, for a ratio of 7.8 per 1,000 live births, an increase over the 1983 ratio of 7.0.

**INFANT DEATHS** ..... Infant deaths are also subject to fluctuations because of the small data base. Generally, infant mortality in Idaho has declined considerably, although the last five years have not seen much change. A total of 174 infant deaths occurred in 1984, compared to 199 in 1983. The 1984 rate of 9.7 is the second-lowest rate ever recorded in Idaho. Neonatal deaths dropped from 5.7 in 1983 to 5.1 in 1984; postneonatal deaths decreased slightly to 4.6 in 1984.

**MATERNAL DEATHS** ..... One Idaho resident died from complications related to childbirth in 1984.

**MARRIAGES** ..... The number and rate of Idaho marriages declined in 1984, from 13,421 (13.6) in 1983, to 13,264 (13.3, provisional) in 1984. The number of marriages is still higher than those recorded in the mid-seventies, but the rate of marriage is generally declining, and at 13.3 is at its lowest point in many years.

**DIVORCES** ..... After sixteen years of annual increases, the number of divorces in Idaho has decreased for three straight years. In 1981, a record-high 6,770 divorces were granted, but only 6,210 occurred in 1984. The rate of divorce has also declined, and at 6.2 (provisional) per 1,000 population, it is the lowest rate since 1974.

# NATALITY

Two percent more infants were born in the United States in 1984 than in 1983, resuming a long trend of increasing numbers of births. The birth rate of 15.7 was 1% higher than the 1983 rate of 15.5 (both provisional); the fertility rate also increased 1%, from 65.4 to 66.0 live births per 1,000 women 15-44 years of age. According to the National Center for Health Statistics, the two percent increase in the number of births, coupled with the one percent increase in the fertility rate, seem to indicate an increase in at least some age-specific birth rates. The number of women 15-24 years of age continues to decline; since this is the age at which nearly half of all births occur, this should keep future increases small.

Contrary to the national trend, Idaho experienced a decline in both the number and rate of births in 1984: the number of live births fell 4%, and the birth rate was down by 5%. Since 1979, Idaho's birthrate has declined nearly 20%. Idaho's 1984 estimated fertility rate (based on 1980 census information) was 83.8 live births per 1,000 women 15-44 years of age. This represents a slight decrease from 87.3 in 1983, but since both rates were based on 1980 census data, no conclusions can be drawn. In comparison, the 1984 national rate was 66.0. Idaho's fertility rates have always been substantially higher than the U.S. rates, but the difference is diminishing: in 1979, Idaho's rate was 43% higher; in 1984, the difference was 25%.

Birth rates in Idaho range from 15.3 in District 1 to 21.4 in District 7. The birth rates of the districts do not vary widely from year to year; areas in the northern and southwestern parts of Idaho traditionally experience much lower birth rates than the southeastern areas.

Four percent of Idaho's 1984 births occurred in a nonhospital setting, slightly over half of which were at home. Nearly all the remainder of nonhospital births were in physicians' clinics. Home births occur most frequently in District 1; two-thirds of the clinic births were in District 3.

Lay midwives, certified nurse midwives (C.N.M.'s) and naturopaths were the most popular alternatives of those mothers who did not choose a physician-attended birth. The districts vary distinctly in this area, as shown on page 24.

# OUT-OF-WEDLOCK BIRTHS

Idaho out-of-wedlock live births declined 6% in 1984 (from 1,768 to 1,668), the first decrease in such births in over a decade. The ratio of out-of-wedlock births to total births also decreased (from 94.1 to 92.4), although 1984 remains higher than all years except 1983. Interestingly, out-of-wedlock ratios **increased** in 1984 for both whites and blacks, but this was more than offset by declines for all other nonwhites, particularly American Indians.

IDAHO RACE-SPECIFIC RATIOS

| | 1984 | 1983 | 1982 | 1981 | Change 1981-84 |
|---|---|---|---|---|---|
| White | 89.2 | 89.0 | 84.0 | 80.9 | +10.3% |
| Black | 189.2 | 156.9 | 148.1 | 140.4 | +34.8 |
| American Indian | 352.2 | 493.3 | 415.9 | 364.9 | -3.5 |
| Japanese | 0.0 | 66.7 | 57.7 | 93.0 | -100.0 |
| Other nonwhite | 41.7 | 81.5 | 103.4 | 38.8 | +7.5 |
| Spanish surname* | 132.4 | 139.6 | 144.1 | 127.6 | +3.8 |

The national out-of-wedlock live birth ratio increased in 1982 (the latest data available) to 194.3; this reflects higher ratios for both whites and blacks, as in Idaho, but also higher ratios for other nonwhites. The U.S. ratios are over twice as high as Idaho's, although the differential is more marked in the nonwhites: national white ratios are only 35% higher, whereas nonwhite ratios are 114% higher than Idaho's.

| | Total | White | Nonwhite | | Spanish Surname* |
|---|---|---|---|---|---|
| | | | Total | Black | |
| U. S. (1982) | 194.3 | 120.7 | 487.5 | 566.8 | 244.6 |
| Idaho (1984) | 92.4 | 89.2 | 227.6 | 189.2 | 132.4 |

When comparing U.S. and Idaho ratios, one should keep in mind several influencing factors:

1. Idaho has a higher birth rate than the nation as a whole; since live births provide the base (denominator) for computing out-of-wedlock ratios, the higher the number of births, the lower the ratio.
2. Idaho has a small nonwhite population; their higher out-of-wedlock ratios have less effect on the overall ratio.
3. The U.S. ratios shown above lag two years behind Idaho's; undoubtedly the 1984 U.S. ratios will be even higher than in 1982.
4. Idaho has a relatively small data base, so some fluctuation is not unexpected.

The map on page 37 demonstrates that Districts 1, 2 and 3 experience the highest out-of-wedlock ratios, with 128.8, 121.5 and 125.4, respectively. Washington was the highest county at 231.3, followed by Nez Perce (183.8) and Shoshone (171.9).

# MORTALITY

After a 4% rise in 1983, Idaho deaths increased just 0.3% in 1984 to 7,229. Even though the rate of death dropped from 7.3 (revised) in 1983 to 7.2 (provisional) in 1984, it appears that Idaho's death rate has ceased its long-term downward trend, as no significant changes have been noted since the mid- to late-seventies. The U.S. death rate was 8.7 in 1984, up slightly from the 1983 rate of 8.6; this is only the fourth time in the past eleven years that the national rate has not recorded a decline. Comparing the national death rate with Idaho's reveals that Idaho rates have historically been lower. Age-adjusted rates* show that even allowing for the differing age structures (Idaho's population is younger), Idaho's death rate is below that of the nation.

The five leading causes of death are: (1) Heart disease, (2) Malignant neoplasms, (3) Cerebrovascular disease, (4) Accidents and (5) Chronic obstructive pulmonary disease (COPD). (COPD was not listed as a single cause prior to 1984; it consists of ICD-9 codes 490-496, and includes, but is not limited to, the Bronchitis, emphysema and asthma designation previously used.) These leading five causes are the same for both the U.S. and Idaho. The next five causes are somewhat different (rates are deaths per 100,000):

| Causes ranked 6-10 in U.S. | Rank in Idaho |
|---|---|
| 6. Pneumonia and influenza (24.9) | 6 (22.3) |
| 7. Diabetes mellitus (15.2) | 8 (13.3) |
| 8. Suicide (11.8) | 7 (15.5) |
| 9. Chronic liver disease and cirrhosis (11.3) | 11 (6.9) |
| 10. Atherosclerosis (10.4) | 10 (9.0) |

Of the ten leading causes in the U.S. in 1984, **increases** were recorded in the rates of death from Malignant neoplasms, Accidents, Chronic obstructive pulmonary disease, and Pneumonia and influenza. Rates **decreased** for Heart disease, Cerebrovascular disease, Chronic liver disease and cirrhosis, and Atherosclerosis.

Comparing Idaho's provisional 1984 rates with 1983 rates reveals that of the ten leading Idaho causes of death, rates **increased** for Heart disease, Malignant neoplasms, Cerebrovascular disease and Diabetes mellitus. **Decreases** were reported for Accidents, Pneumonia and influenza, Suicide, Atherosclerosis, and Other diseases of arteries, arterioles and capillaries.

When making comparisons of 1979-1984 mortality data with earlier years, one must be aware that the manner of coding the underlying cause of death changed in 1979 to the ninth revision of the **International Classification of Diseases** (ICD-9). The introduction of ICD-9 in all states has resulted in a major reclassification of several causes of death. Therefore, there are major discontinuities in the trends for certain causes of death. (Comparability ratios between ICDA-8 and ICD-9 have been published in the Vital Statistics Summaries, 1979-1982.)

**To eliminate the bias inherent in differing age compositions (an older population usually has a higher death rate simply because the risk of dying increases as one ages), age-specific death rates can be calculated. These rates are then applied to a standard population, often the U.S. population, and the composite, or "age-adjusted," death rate is then calculated. Five-year average (1968-1972) death rates were computed for Idaho counties using the U.S. as a standard population, and have been published in several earlier publications of this report.*

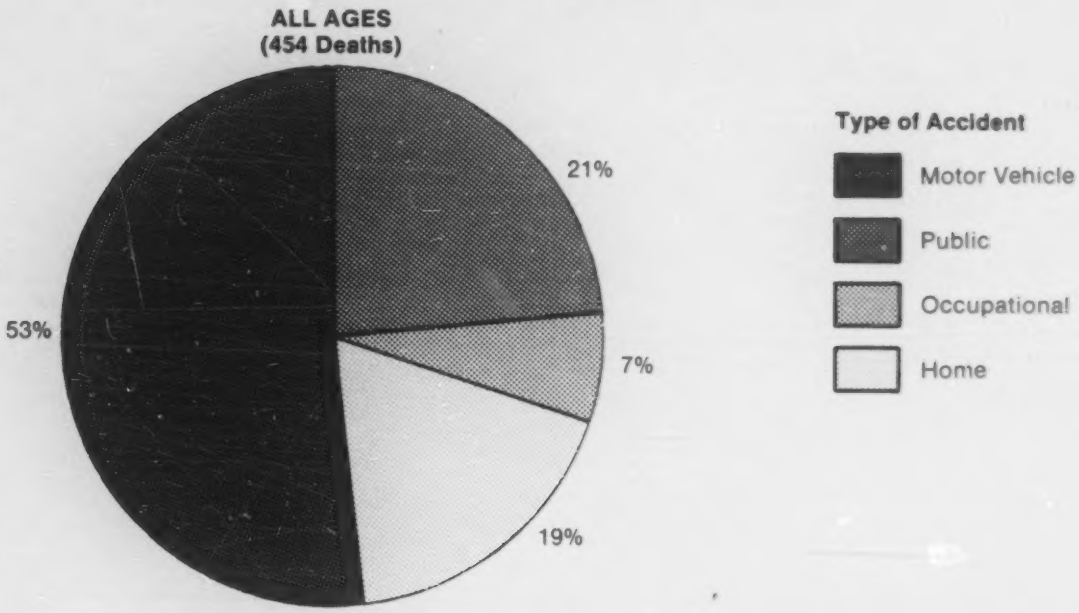
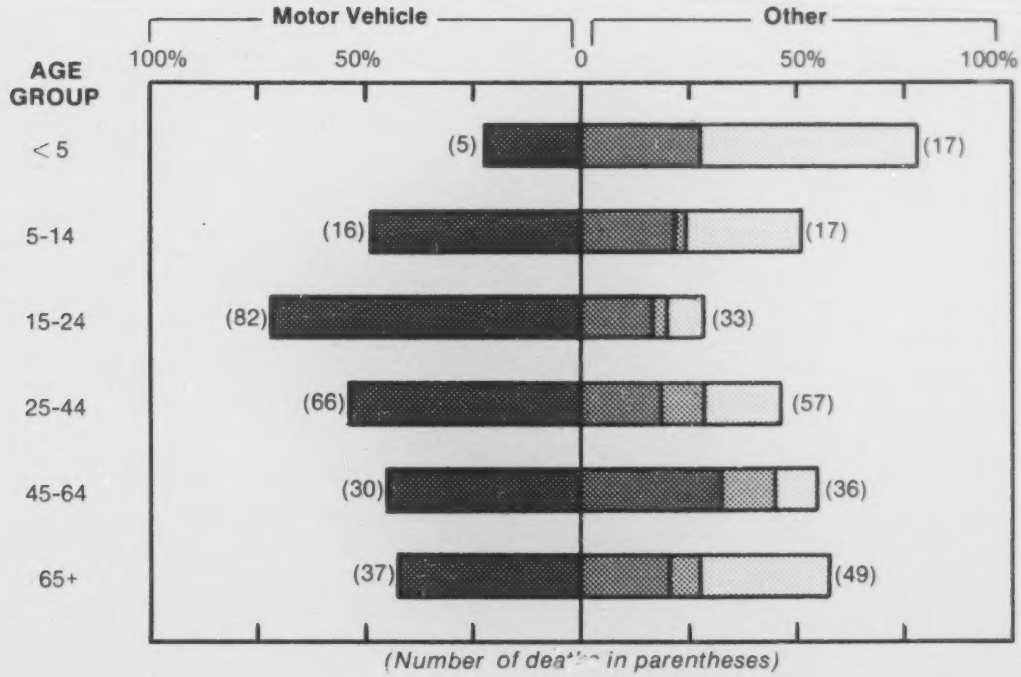
# 1984 ACCIDENTAL DEATHS OCCURRING IN IDAHO

## Age and Category



## CATEGORY BY AGE GROUP



# IDAHO SUICIDES, 1970 - 1984

In Idaho, suicides are the seventh-leading cause of death, compared to the tenth-leading cause in the nation. The national rate peaked at 13.3 per 100,000 population in 1977, and has generally declined since then. Idaho's rates fluctuate more because of the smaller data base, but average slightly above 15 per 100,000. The graph below illustrates that although there is no clear correlation between Idaho and U.S. trends, Idaho has consistently higher suicide rates. Interestingly, suicide rates for both Idaho and U.S. females are nearly identical, but Idaho males commit suicide at a rate nearly one-third higher than U.S. males;* this accounts for Idaho's higher overall suicide rates. Males at all age levels commit suicide at a much higher rate than females, and in Idaho, the difference is even greater: approximately 80% of Idaho's suicides are males, compared to 73% of U.S. suicides.*

Trends in the age- and sex-specific rates in Idaho are somewhat difficult to analyze because of the small data base. Even with three-year averaged rates (see footnote on page 57), general trends must be examined -- a onetime increase in a particular age group is not necessarily significant. Generally, the rates in the older age groups of both sexes have declined, while rates for younger females and middle-aged men have increased. It is interesting to note that, although increasing attention has been focused on teen suicides as a growing public health problem of major proportions, so far Idaho's data do not lend a great deal of support. The chart on the following page does show a small, steady increase in 10-14 year-old male suicides, but the absolute numbers are small. In fact, between 1970 and 1983, the middle-year male rates increased at a greater pace, and rates of the 15-24 year-old males actually declined. (Although 1984 data show increases, single-year rates are more likely to fluctuate; therefore, whether 1984 represents a trend remains to be seen.) Younger suicides do present the greater problems, however, both in terms of personal tragedies and productive years of life lost.

Idaho suicides occur at a higher rate in the central and north central regions. Counties with high rates include Nez Perce, Idaho, Shoshone and Ada.

Because of limited space, only selected data can be shown in this publication; additional information is available upon request.

# INFANT, FETAL AND MATERNAL MORTALITY

The number of Idaho resident infant deaths decreased from 199 in 1983 to 174 in 1984. Even though the number of live births also decreased in 1984, the infant death rate declined from 10.6 to 9.7, second only to 1981 as the lowest rate ever in Idaho. Considering the size of the data base, such fluctuations are not unexpected, as is evidenced by the graph on the following page. The general trend of infant death rates is down, due to the declines in the neonatal death rates. The neonatal death rate dropped from 5.7 in 1983 to 5.1 in 1984, the lowest ever. Postneonatal deaths have not followed the downward trend of Idaho's neonatal death rates; no significant declines have occurred in the postneonatal deaths in the past decade.

Infant mortality in the U.S. continues to decline, from 10.9 in 1983 to 10.6 in 1984. Neonatal deaths decreased from 7.2 to 6.8; postneonatal deaths rose from 3.6 to 3.8. The difference between U.S. and Idaho infant mortality has narrowed considerably, particularly in the last two years (see graph on following page). The composition of the rates varies from year to year, with the lower Idaho neonatal death rates normally accounting for its lower overall infant death rates. Idaho's postneonatal deaths are usually higher than national rates; the higher incidence of SIDS in Idaho appears to account for much of that difference.

In Idaho, District 5 recorded the lowest 1984 infant death rate of 6.5. The highest rate (12.3) was reported by District 7. Perinatal deaths occurred least frequently to District 3 residents (7.9), and most frequently to residents of District 7 (15.4). (The variability of small data bases is demonstrated by the fact that in 1983, District 3 had the highest perinatal mortality ratio in the State.)

Stillbirths (a component of perinatal mortality) increased in 1984 to 7.8 per 1,000 live births, although perinatal mortality declined to 11.7. District stillbirth ratios range from 4.4 in District 3 to 10.2 in District 5.

There was one Idaho maternal death in 1984, a Bannock County resident.

Congenital anomalies remained as the leading single cause of infant deaths in the U.S., but dropped to the second-leading cause in Idaho. The 1984 death rate in Idaho from congenital anomalies dropped from 2.7 in 1983 to 1.7 deaths per 1,000 live births in 1984; the national rate remained at 2.3. The leading cause in Idaho in 1984 was Sudden Infant Death Syndrome (SIDS), increasing from 2.6 to 2.8. Although SIDS is the second-leading cause of infant deaths nationally, the national rate at 1.4 is half Idaho's rate. Districts 1, 3 and 4 recorded the highest SIDS rates in 1984.

Although more neonatal deaths occurred in the general category, "Other conditions originating in the perinatal period" (which includes such conditions as complications of pregnancy and delivery, infections, etc.), the leading single cause of neonatal deaths in Idaho was congenital anomalies (1.2 deaths per 1,000 live births). The second-leading cause was "Disorders relating to short gestation and unspecified low birthweight" (0.7 deaths per 1,000 live births).

In the postneonatal period, SIDS accounted for 55% of the deaths; Idaho's rate of postneonatal deaths from SIDS was 2.6. Congenital anomalies were the second-leading cause of postneonatal mortality with a rate of 0.4.

# Abortion

*Buttercups of many varieties liven the mountains as early as the snow melts.*

# INDUCED ABORTIONS

In the United States, approximately 1.3 million legal abortions were reported to the Center for Disease Control in 1981 (the latest data available).* The abortion ratio (reported abortions per 1,000 live births) decreased slightly from 359/1,000 in 1980 to 358/1,000 in 1981.

Comparative U.S. and Idaho abortion data are listed below. Both represent occurrence, not residence, data.

| | INDUCED ABORTIONS | RATIO PER 1,000 LIVE BIRTHS | RATE PER 1,000 FEMALES, 15-44 |
|---|---|---|---|
| U.S. (1981)* | 1,300,760 | 358 | 24 |
| Idaho (1984) | 2,384 | 132 | 11 |

The reporting of induced abortions in Idaho was not required until July 1, 1977. The reported numbers increased from 708 during the last half of 1977 to a high at 2,706 in 1981. The number of abortions reported in Idaho in 1984 was 2,384.

No maternal deaths have yet been reported from Idaho induced terminations.

For the first time, residence data are available and presented in this section. These include all Idaho residents who obtained abortions in 1984, regardless of the State of abortion. Tables on pages 72, 73 and 74 reflect residence data; tables on pages 72, 75 and 76 reflect only abortions done in Idaho.

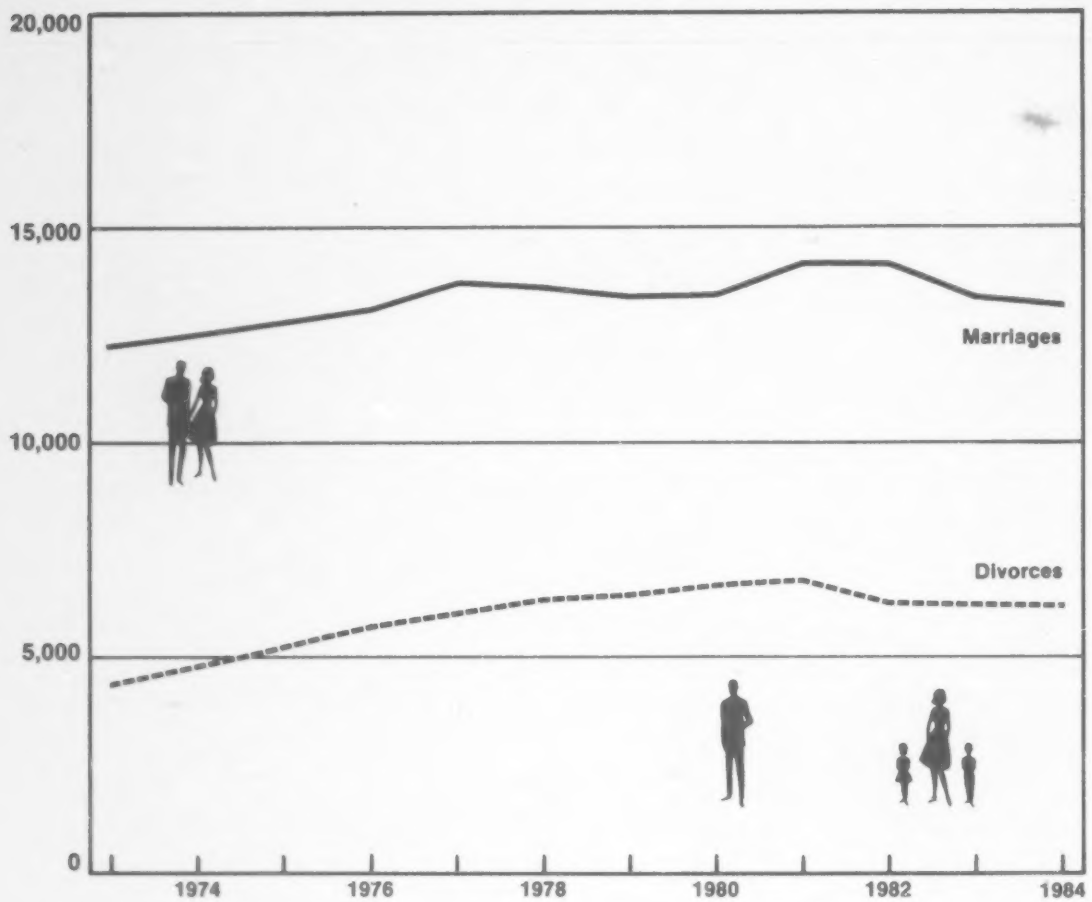
## MARRIAGES AND DIVORCES OCCURRING IN IDAHO
## 1973 - 1984



Both the number and rate of marriages in Idaho decreased again, from 13,421 (13.6) in 1983 to 13,264 (13.3, provisional) in 1984. This decline in the rate is a continuation of the general downward trend of marriage rates in Idaho; at 13.3, it is the lowest in many years. Even so, marriages occur at a higher rate in Idaho than in the U. S. as a whole: the national rate of marriage was 10.5 in 1984 (the same as in 1983, but still lower than any other year since 1979). However, this difference between Idaho and the U.S. can be accounted for by the high number of nonresidents who marry in north Idaho.

Divorces in Idaho recorded the third consecutive numerical decrease in 1984, declining to 6,210 from 6,228 in 1983. The 1984 divorce rate of 6.2 is the lowest since the mid-seventies. Divorces occur less frequently in the remainder of the nation: the U. S. divorce rate in 1984 was just 4.9, down slightly from 5.0 in 1983.
